

Content

Introduction	1
1. Materials	1
1.1. Phase change materials (PCM) for building application	1
1.2. General overview	10
1.3. Selected materials and methods	17
1.3.1. “Du Pont Energain”	18
1.3.2. “Ilkerell Ilkatherm”	18
1.3.3. “BioPCM”	19
1.3.4. Knauf “Comfortboard”	20
1.3.5. Description of experimental research of Knauf “Comfortboard” and Du Pont Energain board	21
1.3.6. Doubts concerning to the economic and environmental evaluation of DuPont Energain board done by A.L.S.Chan	22
1.3.7. Chilled ceiling with integrated PCM	23
1.3.8. Application of PCM under floorheating in combination with PCM wallboards for space heatinh ussing price based control system	24
1.3.9. Evaluation of phase change materials for improving thermal comfort in a super insulated residential building using BioPCM25	
Conclusions	26
Bibliography	27
1.4. Thermal insulation materials	31
1.4.1. General overview	31
1.4.2. Advanced insulation materials	32
1.4.3. Selected advanced insulation materials	35
1.4.4. Vacuum insulation panels (VIPs)	39
1.4.5. Ecological/local insulation materials	41
1.4.6. Standart insulation materials with lowered thermal conductivity	45
1.4.7. Environmental impact of insultaion materials	47
Conlusions	50
Bibliography	52
2. Innovative solutions of heating, cooling and ventilation systems for nZEB in cold climate	54
2.1. Introduction	54
2.2. Active heat supply solutions	55
2.2.1. Conventional heating systems	55
2.2.2. Alternative heating systems	56
2.2.3. Passive solutions	62
2.2.4. Shading with plants and green roofs	63
2.2.5. Trombe wall	63
2.3. Ventilation systems	65
2.3.1. System type	65
2.3.2. Ground-to-air heat excanger for preheating of supply air	67
Conlusions	68
References	69

3.	Systems and software for the management of smart buildings	69
3.1.	Introduction to smart buildings	69
3.2.	Control within smart buildings using management system	72
3.3.	Overview of systems and protocols for a smart building control	76
3.4.	Most popular BMS protocols	78
3.5.	An example of systems and software use in a real nZEB building	82
3.6.	Analysis and conclusion	86
	Recommendations	86
	Literature	86
4.	Design, installation, operation and human behaviour influence on energy consumption of HVAC system	88
4.1.	Introduction	88
4.2.	Design stage	88
4.3.	Heating systems	89
4.4.	Ventilation system	94
4.5.	System installation stage	95
	Conclusions	99
5.	Important aspects of human thermal comfort in nZEB	100
5.1.	Introduction	100
5.2.	Thermal manikins as nowadays instrument to improve HVAC systems	100
5.3.	Thermal comfort	102
5.3.1.	Comfort zones for indoor occupants	102
5.3.2.	Spatial transients and thermoreception	103
5.3.3.	Circadian rhythm	105
5.3.4.	Non-uniformities of the human body	106
5.3.5.	Alliesthesia	107
5.3.6.	Trend for green buildings	108
	Conclusions	108
	References	109
6.	The quality of living environment and the sustainability of building structures	110
6.1.	Introduction	110
6.2.	Risk of development of microbiological contamination	110
6.3.	Requirements for the indoor climate quality	114
6.4.	Use of moisture buffering materials	115
6.5.	Natural insulation materials	115
6.6.	Effective ventilation system-earth-air heat exchanger	124
6.7.	Intelligent facades	126
6.8.	Innovative finishing materials	128
6.9.	Greening systems	130
6.10.	Mould prediction models	133
6.11.	Comments and recommendations	139
	References	141
7.	Sensors, monitoring, data logging and post processing	146
7.1.	Introduction	146
7.2.	Temperature and humidity sensors	146

7.2.1.	Temperature sensors	146
7.2.2.	Humidity sensors	147
7.2.3.	Conclusions on temperature and humidity sensors	148
7.2.4.	Heat flux sensors	148
7.2.5.	Implementation	148
7.3.	Data transmission	149
7.4.	Sensor node and power requirements	150
7.4.1.	Sensor node implementation	150
7.4.2.	Data transmission	153
7.5.	Power requirements	154
7.5.1.	Voltage regulators and batteries	154
7.5.2.	Extensions	156
7.6.	Energy harvesting potential	156
7.7.	Data storage and pre-processing	157
